

## Floyd Warshall Algorithm $\rightarrow$

This algorithm considers the intermediate vertices of a shortest path where an intermediate vertex of a simple path  $P = \langle V_1, V_2, \dots, V_m \rangle$  is any vertex of  $P$  other than  $V_1$  and  $V_m$ .

The Floyd Warshall algo is based on the following:

Let vertices of  $G$  be  $V = \{1, 2, 3, \dots, n\}$

Consider a subset of vertices  $\{1, 2, \dots, k\}$

For any pair of vertices  $u, j \in V$ , consider all ~~paths~~ paths from  $u$  to  $j$  whose intermediate vertices are all drawn from  $\{1, 2, \dots, k\}$  and let  $p$  be the minimum weight path among them.

$\rightarrow$  If  $k$  is not an intermediate vertex of path  $P$ , then all intermediate vertices of path  $P$  are in the set  $\{1, 2, \dots, k-1\}$ .

$\rightarrow$  If  $k$  is an intermediate vertex of path  $P$ , then we break  $P$  down into  $u \xrightarrow{P_1} k \xrightarrow{P_2} j$

$\rightarrow$  Let  $d_{uj}^k$  be the weight of a shortest path from vertex  $u$  to vertex  $j$  with all intermediate vertices in the set  $\{1, 2, \dots, k\}$

$$d_{uj}^k = \begin{cases} w_{uj} & \text{if } k=0 \\ \min(d_{uj}^{(k-1)}, d_{uk}^{(k-1)} + d_{kj}^{(k-1)}) & \text{if } k \geq 1 \end{cases}$$

## Algorithm:

Floyd\_Warshall( $w$ )

1.  $n \leftarrow \text{rows}(w)$
2.  $D^0 \leftarrow w$
3. For  $k \leftarrow 1$  to  $N$
4.   do for  $i \leftarrow 1$  to  $N$
5.     do for  $j \leftarrow 1$  to  $N$
6.       do  $d_{ij}^k = \min(d_{ij}^{k-1}, d_{ik}^{k-1} + d_{kj}^{k-1})$
7. return  $D^n$

The strategy adopted by Floyd Warshall algo is called Dynamic Programming.

The running time is  $O(n^3)$

Q. Apply Floyd Warshall algorithm for constructing shortest path. Show the matrix  $D^k$  that results in each iteration. Also find the minimum cost from node 3 to node 1 and the corresponding path also.
